C-Reactive Protein (CRP), Serum

Date 13/Jan/2024 Unit Bio Ref Interval

10:11AM

CRP 1.14 mg/L <5.0

Immunoturbidimetry

Comments: C- reactive protein (CRP) is an In vitro test for the quantitative immunological determination of C reactive protein in human serum and plasma .Its an acute phase protein produced by liver.It is used as a marker of acute inflammation and infection where its levels rise.It rises within 6 hours, and peaks at 48 hours.It is non specific to diagnose a particular disease. Serum samples containing rheumatoid factor, paraproteins or circulating immune complexes generate unpredictable degree of non- specific scatter, thus limiting the test result.Diagnosis cannot be made and treatment must not be initiated on the basis of CRP measurements alone.Measuring range 0.5-300 mg/L.

Comment

Note: Methodology of estimation of Low density lipoprotein cholesterol has been changed to direct estimation (enzymatic method) instead of calculation wef from 08-05-2019.

Note: Friedewald equation does not hold true as direct Low density lipoprotein cholesterol

is being reported instead of calculated.

VLDL-Cholesterol is calculated by using formula: Serum Triglycerides/5

INTERPRETATION:

Cholesterol(Enzymatic):

 $\begin{array}{ll} \mbox{Desirable} & : < 200 \ \mbox{mg/dl} \\ \mbox{Borderline} & : 200 - 239 \ \mbox{mg/dl} \\ \mbox{High} & :> 240 \ \mbox{mg/dl} \end{array}$

Triglyceride (Enzymatic):

Desirable : < 150 mg/dl Borderline High : 150 - 199 mg/dl High : 200 - 499 mg/dl VeryHigh : > 500 mg/dl

HDL Cholesterol (Enzymatic):

 $\begin{array}{ll} \mbox{Desirable} & :>60 \mbox{ mg/dl} \\ \mbox{Borderline} & :40-60 \mbox{ mg/dl} \\ \mbox{Low} & :<40 \mbox{ mg/dl} \\ \end{array}$

DL Cholesterol (Enzymatic): < 100 mg/dl (Calculated)

Comment

Rheumatoid factors are a heterogeneous group of autoantibodies directed against the antigenic determinants on the Fc-region of IgG molecules.

They are important in the diagnosis of rheumatoid arthritis, but can also be found in other inflammatory rheumatic diseases and in various non-rheumatic diseases. They are also

found in clinically healthy persons over 60 years of age.

Hepatitis B Surface Antigen, Serum

CLIA

HBsAg Non Reactive

CLIA

Comment

The detection of HBsAg in human serum or plasma indicates an infection by the hepatitis B virus. HBsAg is the first immunological marker and is generally present some days or weeks before clinical symptoms begin to appear. HBsAg is observed in persons with acute and chronic hepatitis B infections.

A negative test result does not exclude with certainty a possible exposure to or an infection with the hepatitis B virus.

All positive samples must be confirmed with a confirmatory test like HBV DNA PCR.

Hepatitis B Surface Antibodies/Antibodies to HBs, Serum(HBsAb)*

CLIA

Anti Hbs Titre <2.0 mIU/mL

Ref. Range Non-immune < 10.0

Immune ≥ 10.0

Interpretation

It may be used to monitor the response to Hepatitis B Vaccination or recovery from an acute HBV infection. Anti HBs titre of more than 10 mIU/ml is probable protective.

Certain drugs and clinical conditions are known to alter anti HBs concentration in vivo.

HCV IgG Antibody (Hepatitis C Virus)*

CLIA

HCV, IgG NON REACTIVE CLIA

Kindly correlate with clinical findings
